

### Tasks

- A) Check if there's any low stock of ingredients
- B) Add this amount of ingredients to the stock

### Design Sketch

## Paper Prototyping: Task B Photo Recognition

### After testing the photo prototype...

- Issues and comments
  - In the beginning, the participant was a little confused about how to begin after I gave them the task, "Add this number of ingredients (apples) to Apple stock." The user was thinking of searching up the name of the ingredient first instead of clicking the + icon, similar to the text entry part in my design sketch. I'm guessing that the user might have thought that + icon might be relating to something else. During the interview, I just realized that when you're adding a number of ingredients, the units or measurements were important to specify in each ingredient. Besides that the test went smoothly. The user mentioned that it was easy to use once you figure them out the first time. After the first time, the user knew what to do straight off the bat. Because of that comment from the user, I thought there shouldn't be any changes to the problem that we had in the beginning (clicking + icon first instead of search icon).
