

FP2: Final Project Specification

CSCI 3302: Introduction to Robotics

The goals of this assignment are:

- Finalize your project proposal based on any feedback you've received from course staff or any technical challenges you've encountered causing you to re-think aspects of your initial proposal.
- Raise an alarm early for any technical problems you're encountering, allowing you to pivot your project idea or receive help to accomplish your initial goals.

To Submit on Canvas: PDF of your final draft project proposal, using the same format as the initial project proposal.

The content of this submission should be coming from your initial proposal (from assignment FP1). While the initial proposals were not graded for content, these final proposals will be graded for adherence to the instructions and will serve as the basis for scoring your final submissions (i.e., did you accomplish something close to your proposal?).

Reminder: For each major feature or component of your project, you must assign one of your project members to be responsible for its completion, even if you're all working on it together (this person will be responsible for coordinating effort around this deliverable, making sure it progresses on schedule / raising concerns with course staff early if things aren't proceeding according to plan).
